

VortexIQ API Reference Guide v1.0

Complete developer documentation for the VortexIQ REST API

Section 1: Authentication

All API requests require authentication using an API key.

Include your API key in the Authorization header as Bearer YOUR_API_KEY.

API keys can be generated from Settings then Developer then API Keys.

Each key can be given a name and optional expiry date for security.

Rotate your API keys every 90 days as a security best practice.

Never expose API keys in frontend code or public repositories.

If a key is compromised delete it immediately and generate a new one.

Section 2: Base URL and Versioning

The base URL for all API requests is <https://api.vortexiq.com/v1>.

VortexIQ uses URL versioning so breaking changes are released as new versions.

The current stable version is v1. A v2 beta is available at api.vortexiq.com/v2.

Always specify the version in your requests to avoid breaking changes.

Section 3: Rate Limits

Free plan accounts are limited to 100 API requests per hour.

Starter plan accounts are limited to 500 requests per hour.

Pro plan accounts are limited to 2000 requests per hour.

Enterprise accounts have custom rate limits negotiated at contract time.

Rate limit headers are included in every response: X-RateLimit-Limit,

X-RateLimit-Remaining, and X-RateLimit-Reset.

When you exceed the rate limit the API returns a 429 Too Many Requests error.

Implement exponential backoff when you receive a 429 response.

Section 4: Common HTTP Status Codes

200 OK means the request was successful and the response contains data.

201 Created means a new resource was successfully created.

400 Bad Request means the request body or parameters are invalid.

401 Unauthorized means the API key is missing invalid or expired.

403 Forbidden means the API key does not have permission for this action.

404 Not Found means the requested resource does not exist.

429 Too Many Requests means you have exceeded your rate limit.

500 Internal Server Error means an unexpected error occurred on our side.

Section 5: Projects API

GET /v1/projects returns a list of all projects in your workspace.

POST /v1/projects creates a new project with name and description fields.

GET /v1/projects/{id} returns details of a specific project.

PATCH /v1/projects/{id} updates a project name description or status.

DELETE /v1/projects/{id} permanently deletes a project and all its content.

Projects can be filtered by status using the status query parameter.

Available status values are active archived and deleted.

Section 6: Tasks API

GET /v1/projects/{id}/tasks returns all tasks within a project.

POST /v1/projects/{id}/tasks creates a new task in the specified project.

Task fields include title description assignee due_date priority and status.

Priority values are low medium high and urgent.

Task status values are todo in_progress review done and cancelled.

PATCH /v1/tasks/{id} updates any field of an existing task.

DELETE /v1/tasks/{id} deletes a task permanently.

Tasks support bulk operations via POST /v1/tasks/bulk.

Section 7: Webhooks

Webhooks allow VortexIQ to notify your application when events occur.

Webhooks are available on Pro and Enterprise plans only.

Register a webhook URL from Settings then Developer then Webhooks.

Supported webhook events include task.created task.updated task.deleted, project.created project.archived and user.invited.

Each webhook payload includes event type timestamp and resource data.

Webhook requests include a signature header for verification.

Verify the signature using your webhook secret to prevent spoofing.

Failed webhook deliveries are retried up to 5 times with exponential backoff.

Section 8: SDKs and Libraries

Official VortexIQ SDKs are available for Python JavaScript and Ruby.

Install the Python SDK with pip install vortexiq.

Install the JavaScript SDK with npm install vortexiq-js.

Community SDKs are available for Go PHP and Java on GitHub.

Full SDK documentation is available at docs.vortexiq.com/sdks.

All SDKs support automatic retry on rate limit errors.

The Python SDK requires Python 3.8 or higher.
